GALILEO

Galileo Open APIs

Galileo's Open APIs connect you to the most advanced capabilities in fintech and payments—with power, speed and simplicity.

Create unique programs. Differentiate your business. Engage your customers.

Galileo's robust open APIs unlock the creativity of your developers to innovate without limitation.

Galileo Program Master API

Create sophisticated, integrated financial solutions quickly and easily.

The Program Master API leverages Galileo's advanced platform to provide the comprehensive technology to support the complex, behind-the-scenes functionality required for financial programs.

Even if your developers are new to financial services, they can use the Galileo Program Master API to open accounts and create cards to deliver sophisticated, integrated financial solutions quickly and easily.

And, with the back office covered, your developers can focus on integrating solutions into your business logic and creating user-facing components that differentiate your programs, ensure your end-to-end control of the user experience and delight customers.

Galileo Authorization Controller API

Experience the power of always knowing what's happening in your portfolio.

Use the Authorization Controller API to participate in advanced authorization decisioning for your customers' transaction activity.

After a transaction is reviewed by your payments network and Galileo, you receive it—along with the approve/decline recommendation–for further consideration. You may accept or override the recommendation. Or, you may apply proprietary logic or criteria–such as extending funds to avoid overdrafts, restricting teens from inappropriate MCCs and converting funds to other currencies—before authorizing/declining the transaction.

Your active participation in authorization decisioning protects your customers' positive experiences by enabling you to give extra consideration to transactions made by your VIP customers, younger customers and those transacting in multiple currencies and cryptocurrencies.

The Galileo Real-Time Events API

Always know what's happening in your portfolio.

The Galileo Real-Time Events API provides real-time notification of your customers' activities—such as changes in card status, authorization, settlement and deposits—as events happen.

We push event notifications to your endpoint or server for full transparency of your customers' activity, creating new opportunities to improve operations, detect fraud and target-market based on customer behavior.

Using our Real-Time Events API, you eliminate batch processing delays created by massive end-of-day batch files. And, by applying your proprietary logic to specific situations, you can launch your own custom push notices to verify customer activity that appears suspicious and launch predictive campaigning to engage customers in the moment.
